Data Integration and Data Intelligence Software

**Simon Ellis**, Program Vice President,  
Supply Chain Strategies

June 2020

# Supply Chain Integration and Management Challenges

Facing a rising tide of data volume, distribution, and diversity.

Enterprises were responsible for 53% of all data created in 2018.

## 33 ZB

of new data was created in 2018. IDC estimates a five-year compound annual growth rate of **25%** to result in **103 ZB** of new data created in 2023. (1 ZB = 1 trillion gigabytes)

## 86%

of the 33 ZB volume was generated by **replication and distribution**, creating data liabilities.

## 27%

of this new data was **useful if tagged**, but **only 25%** of the useful data **was tagged**, resulting in the majority of useful data being undefined and its integrity unknown.

## 16%

of the new data created in 2018 was real-time. This is forecasted to grow to **25%** by 2023.

# 82%

of supply chains view data and analytics as either critical or very important to the future success of their business.

Source: IDC, Supply Chain Survey, April 2020

Source: IDC, Worldwide Global DataSphere Forecast, 2019-2023

Data is being created at the edge and in the core, and distributed to end points at rest and in motion.

# Integration in the Digital Economy is Complex and Dynamic

**Most companies “miss” material amounts of available data.**

Only **26%** of supply chains say that their analytics capabilities are comprehensive.

**43%** say they have good but not comprehensive analytics.

**31%** say their analytics are insufficient or poor.

Source: IDC, Supply Chain Survey, April 2020

# Highly Distributed and Diverse Data Environments Are Common in the Digital Economy

**Legacy data management technologies and data types continue to be a part of digital environments.**

## Data Environments for Data Integration Solutions

Source: IDC, Data Integration and Integrity End User Survey, 2019

The diversity of data management technologies adds to the complexity:

- Mainframe
- Relational databases
- Analytical databases
- Data lakes
- No SQL
- In-memory
- Streaming

**Almost 90%** of supply chains either are already on the cloud or plan to be within 12 months for material portions of their supply chain applications.

**81%** of supply chains are participating in at least one multi-enterprise B2B commerce network.

# Supply Chain Management and Integration in the Digital Economy Is Hard, Demanding New Technology and Skills

## Data Management Challenges

Source: IDC, Data Integration and Integrity End User Survey, 2019

The use of new technology is the **top driver of change** in the supply chain, according to IDC's 2020 survey, but companies consistently report data quality and data integration challenges.

Specialized analytics tools to manage data and data integration are **prioritized by 47%** of manufacturing and retail supply chains.

The ability to ingest broad and deep data sets to inform better decision making will be the **single largest differentiator** of supply chain performance in the future.

The skills to manage this complexity in the supply chain are difficult to find, but necessary to improve operational and analytic outcomes.

# Use Cases

These use cases are examples of the need to integrate external systems with internal systems.

- Each use case has a different set of systems, entities, and operational characteristics.
- Each use case has unique integration characteristics and requirements.
- These use cases also share common elements and characteristics.

---

Integration challenges are therefore, paradoxically, both unique and common.

1

Inventory stock and location checks

2

Track and trace

3

Supply chain finance

4

Just-in-time manufacturing

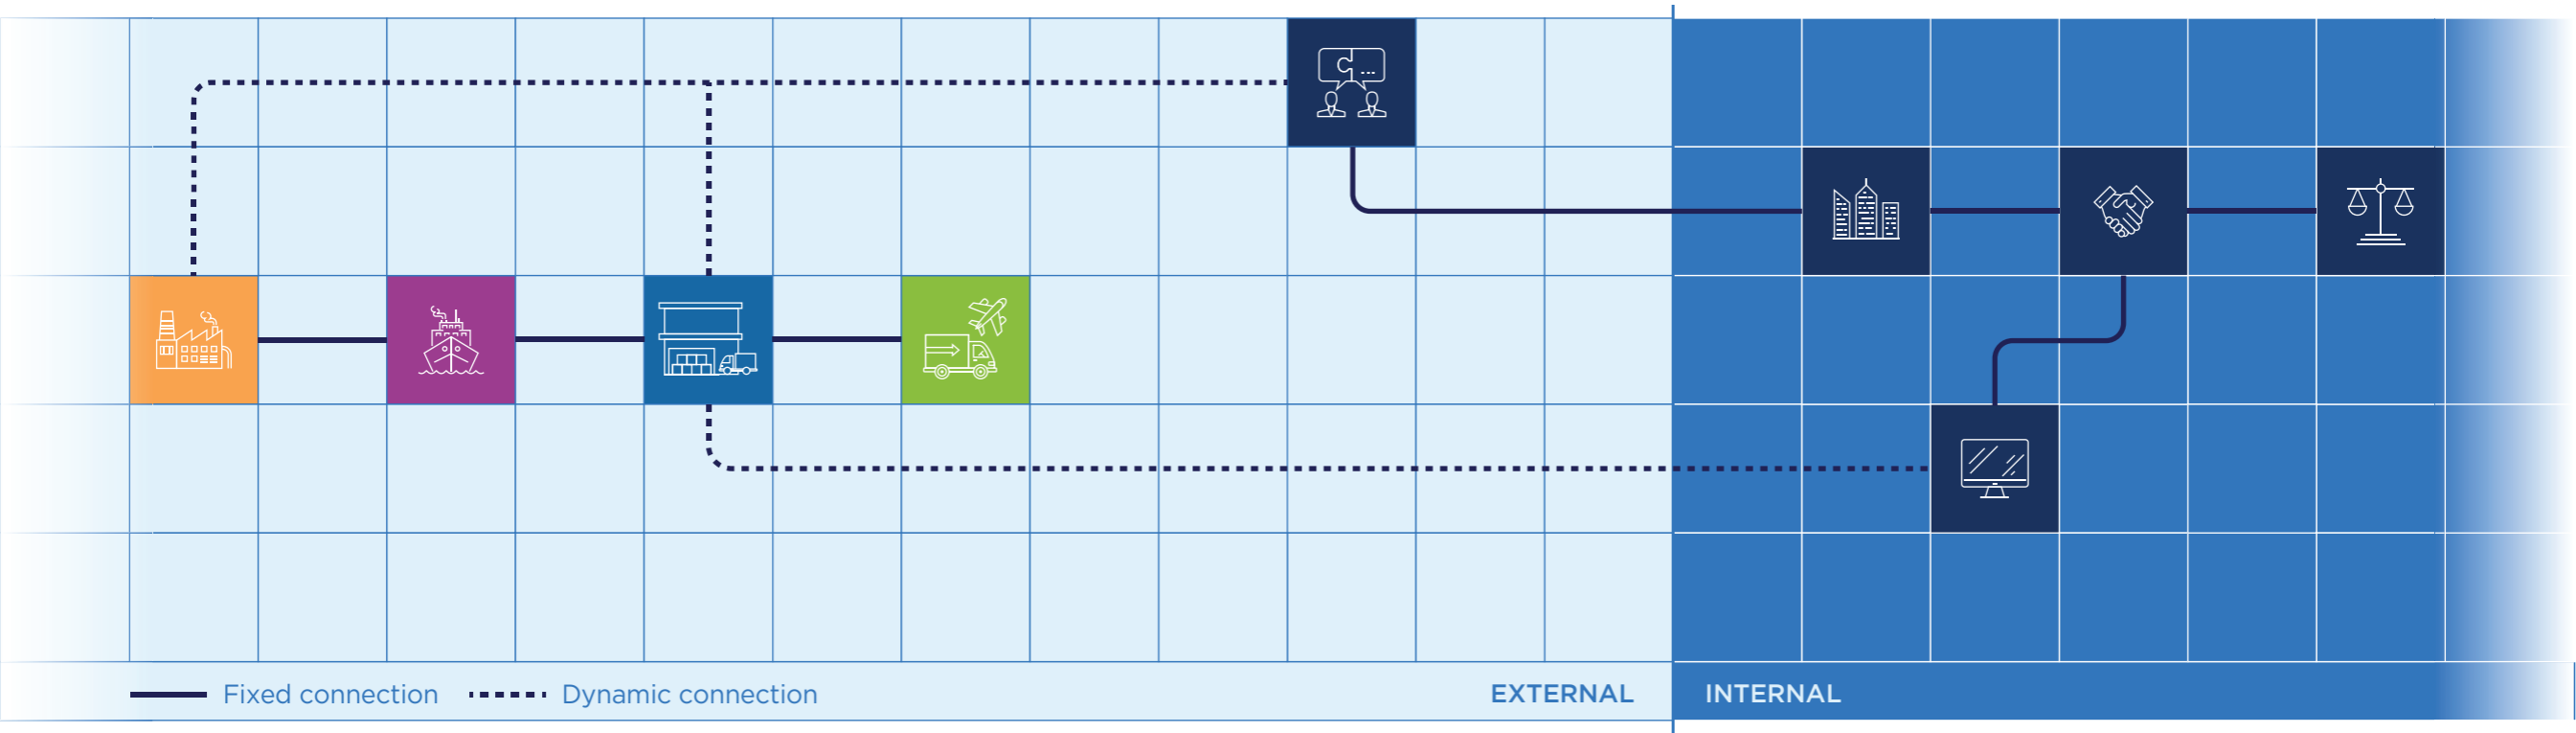

5

Supply chain disruption management

## Use Case

# Inventory Stock and Location Checks

**COVID-19 has exposed supply chain inventory management limitations:**

“I don’t know where things are or how much I have.”

### Challenges

- Security (external and internal)
- Variety of API formats and protocols
- Variety of internal system interfaces
- Elastic demand
- Balancing working capital costs and customer service performance

### External

- Buyers (procurement)
- Suppliers (shipping)
- Consigners (inventory)
- Distributors (logistics)
- IoT devices (RFID, GPS)

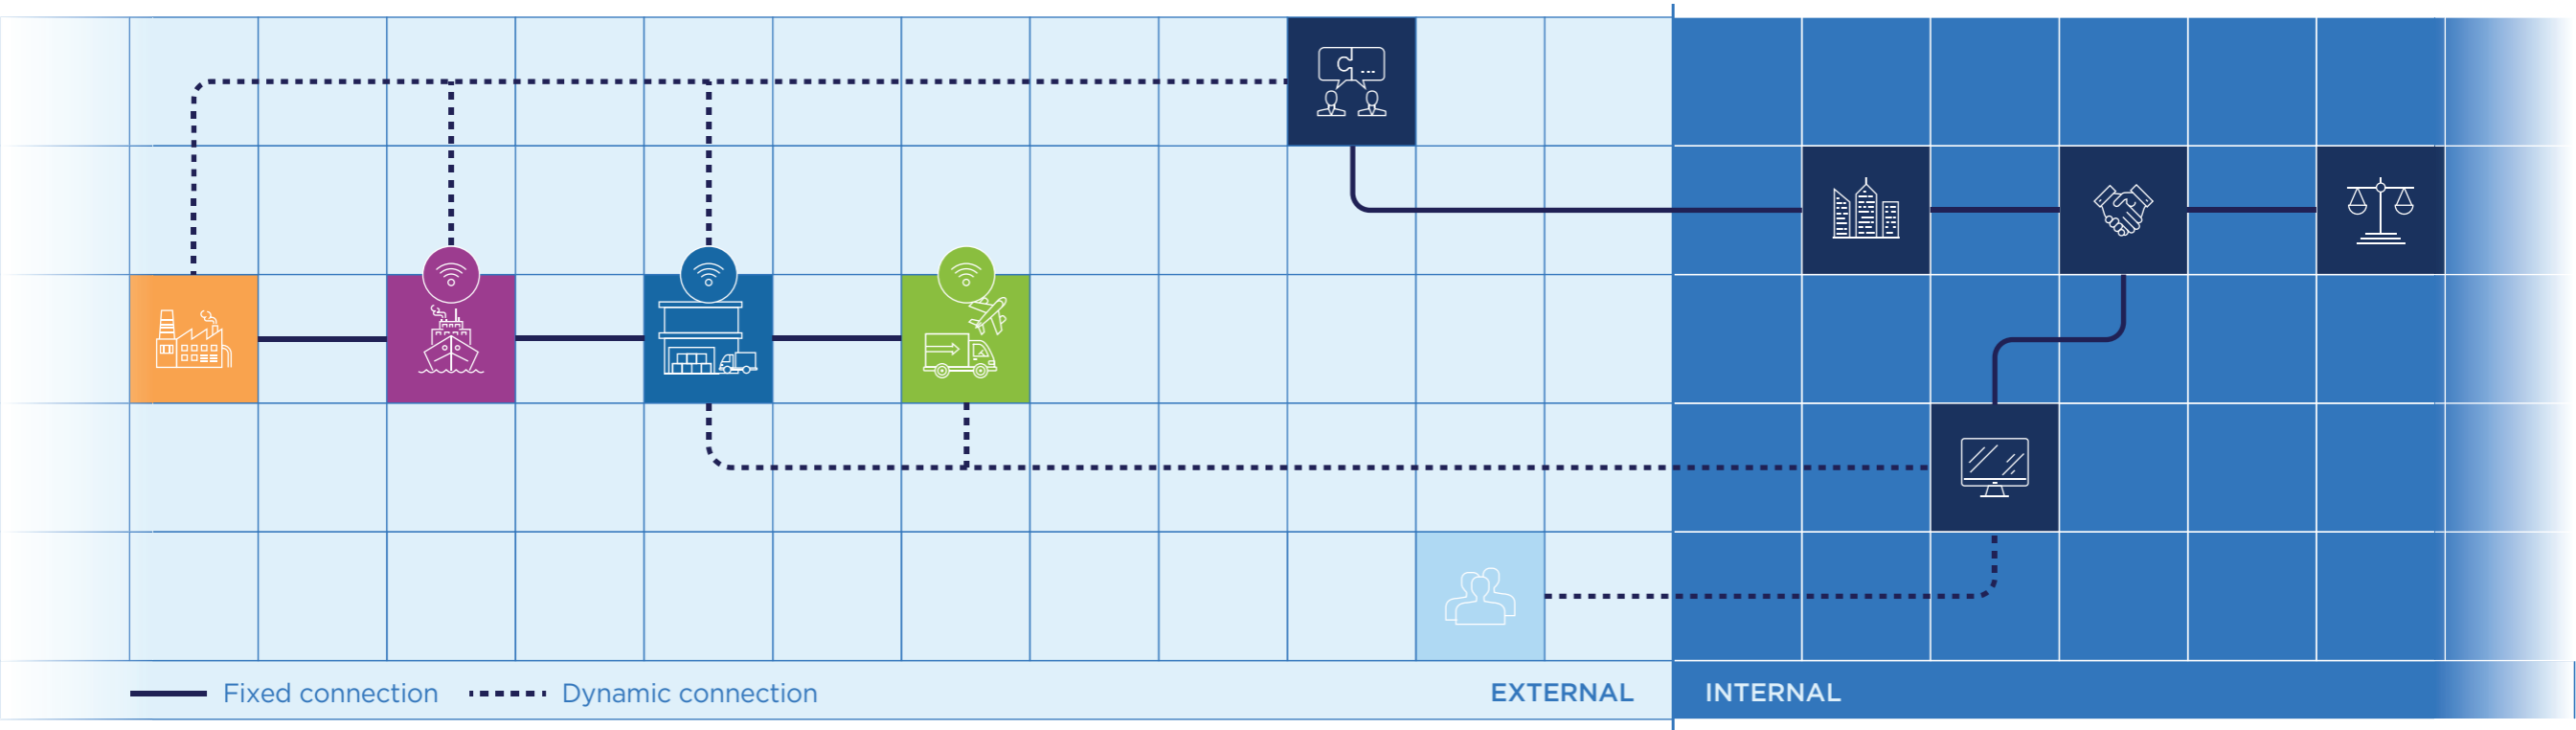

APIs

### Internal

- Inventory management systems
- Warehouse systems
- Store information systems
- Sales systems
- Procurement systems

# Use Case

## Track and Trace

**Supply chains cannot respond to something they don't see: End-to-end supply chain is the top area of focus for visibility.**

Source: IDC, Supply Chain Survey, April 2020

**Challenges**

- Security (external and internal)
- Variety of API formats and protocols
- Variety of internal system interfaces
- End-to-end data visibility
- Elasticity
- Brand image and expectations

**External**

- Buyers (procurement)
- Suppliers (shipping)
- Distributors (logistics)
- IoT devices (GPS, temperature, RFID)

**Internal**

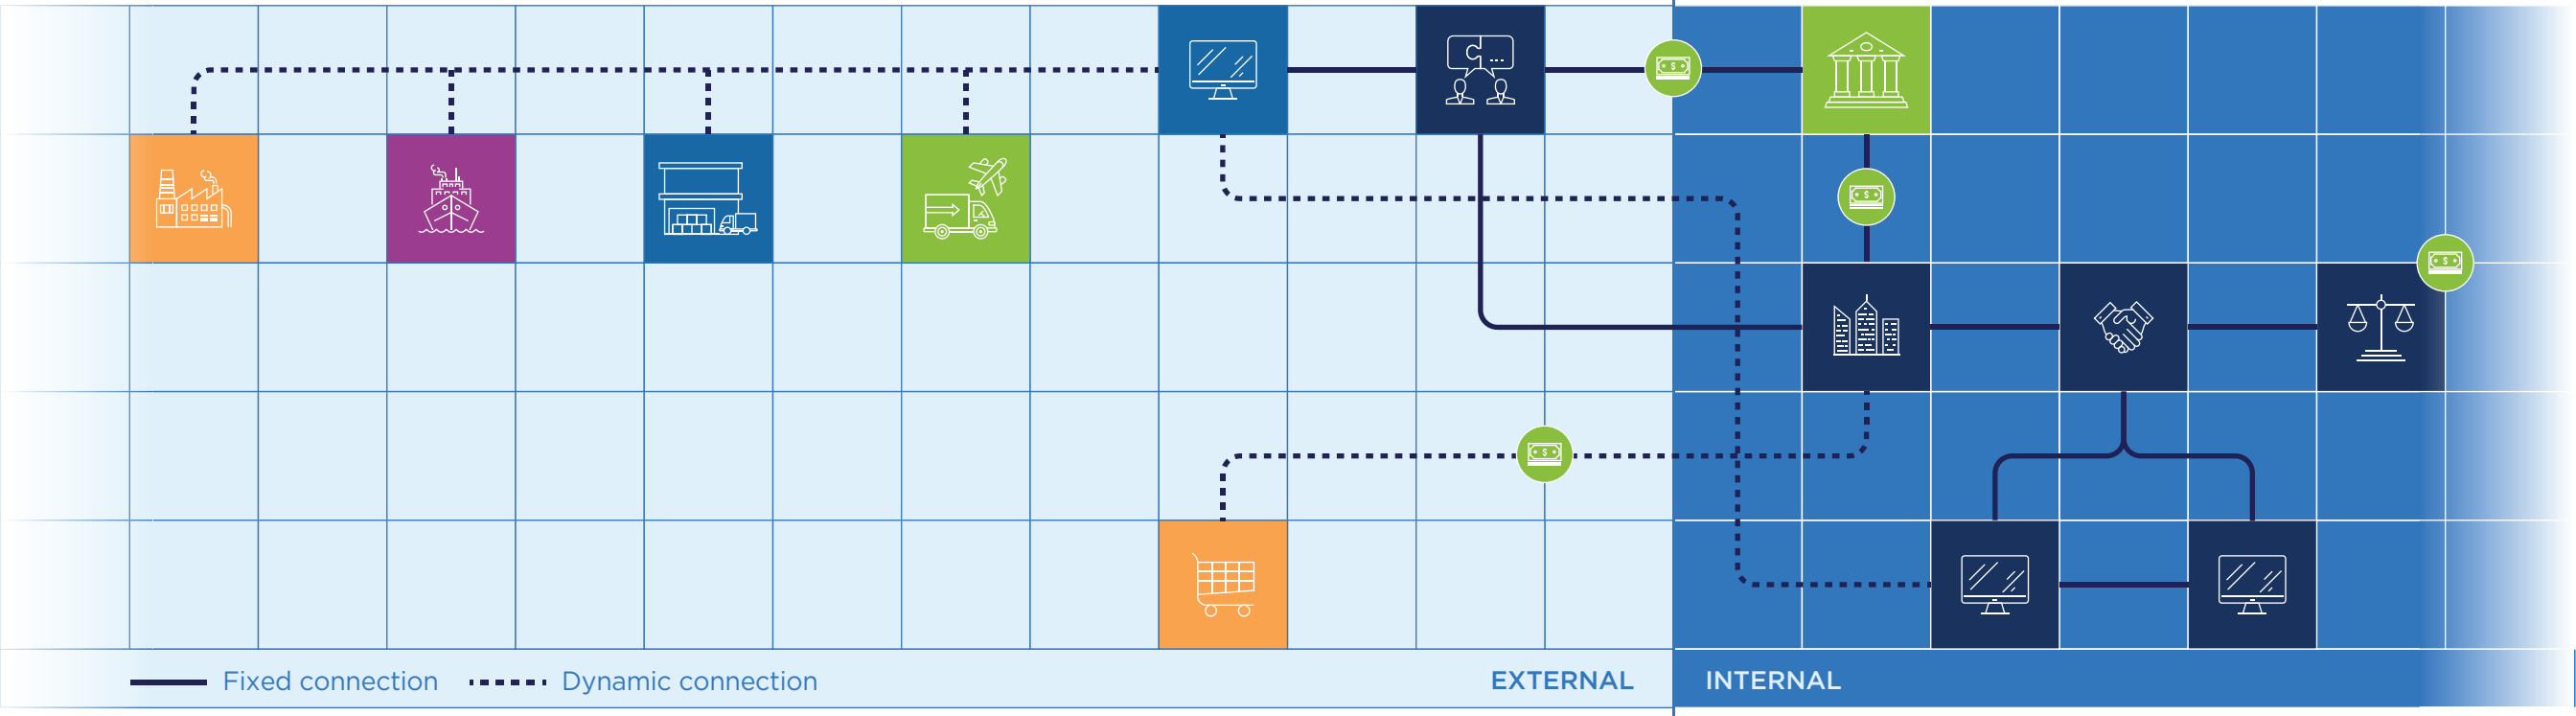

- Logistics systems
- Quality systems
- Site information systems
- Procurement and accounts payable systems

APIs and EDI

Use Case

# Supply Chain Finance

**42% of supply chains report cost reduction — including working capital — as an important driver of change.**

Source: IDC, Supply Chain Survey, April 2020

- Challenges**
- Manage physical, information and financial flows
  - Security (external and internal)
  - Regulatory controls and reporting
  - Variety of API formats and protocols
  - Variety of internal system interfaces
  - Cash flow liquidity and working capital requirements

- External**
- Buyers (accounts payable)
  - Suppliers (invoicing)
  - Distributors (orders, invoicing)
  - Financial Institutions (payments)

- Internal**
- Procurement and accounts payable systems
  - Receiving systems
  - Payments systems
  - General ledger accounting systems

EDI

## Use Case

# Supply Chain Disruption Management

**Supply chain resiliency is the second-highest driver of change in the supply chain.**

Source: IDC, Supply Chain Survey, April 2020

### Challenges

- Security (external and internal)
- Limited end-to-end data visibility
- Supply chain calibration and collaboration
- Timeliness of data
- Minimizing downtime
- Short timeline for new partner onboarding
- Different varieties of API formats and protocols

### External

- New/alternate suppliers
- New/alternate distributors
- Global/regional diversification
- End-to-end visibility
- Broken connections

APIs and EDI

### Internal

- Production planning systems
- Receiving systems
- Distribution systems
- Manufacturing execution systems
- Inventory management

# Data Exchange in the Digital Economy

## Platform and managed services requirements

### Functional

- API protocols and data format variety
- End-to-end data visibility
- Process orchestration
- Self-service

### DevOps

- Partner onboarding and mapping
- Internal systems API enablement
- External to/from internal mapping
- Monitoring and management

### Nonfunctional

- Secure and compliant
- Scalable and elastic
- Flexible and adaptable
- Available and auditable
- Valued user experience for IT and business users

### DataOps

- Pipeline develop/deploy
- Statistical quality control
- Analytics develop/deploy

## Benefits of platform and managed services modernization

### Unification

- Harmonization of disparate and diverse integration solutions
- Visibility across information flows to enable better-informed business decisions
- Centralized and collaborative governance for efficient control

### Scalability and Resiliency

- Leverage cloud infrastructure and ecosystem connectivity for optimal uptime and broad reach
- Agility to respond quickly to customer or market changes
- Managed data quality increasing trust of data-driven outcomes in the extended enterprise

### Digital Business

- Enabling digital transformation initiatives with data and agile integration
- Faster time-to-market
- Improved customer and partner engagement
- Focus on business operations and transformation for growth

### Cost Optimized

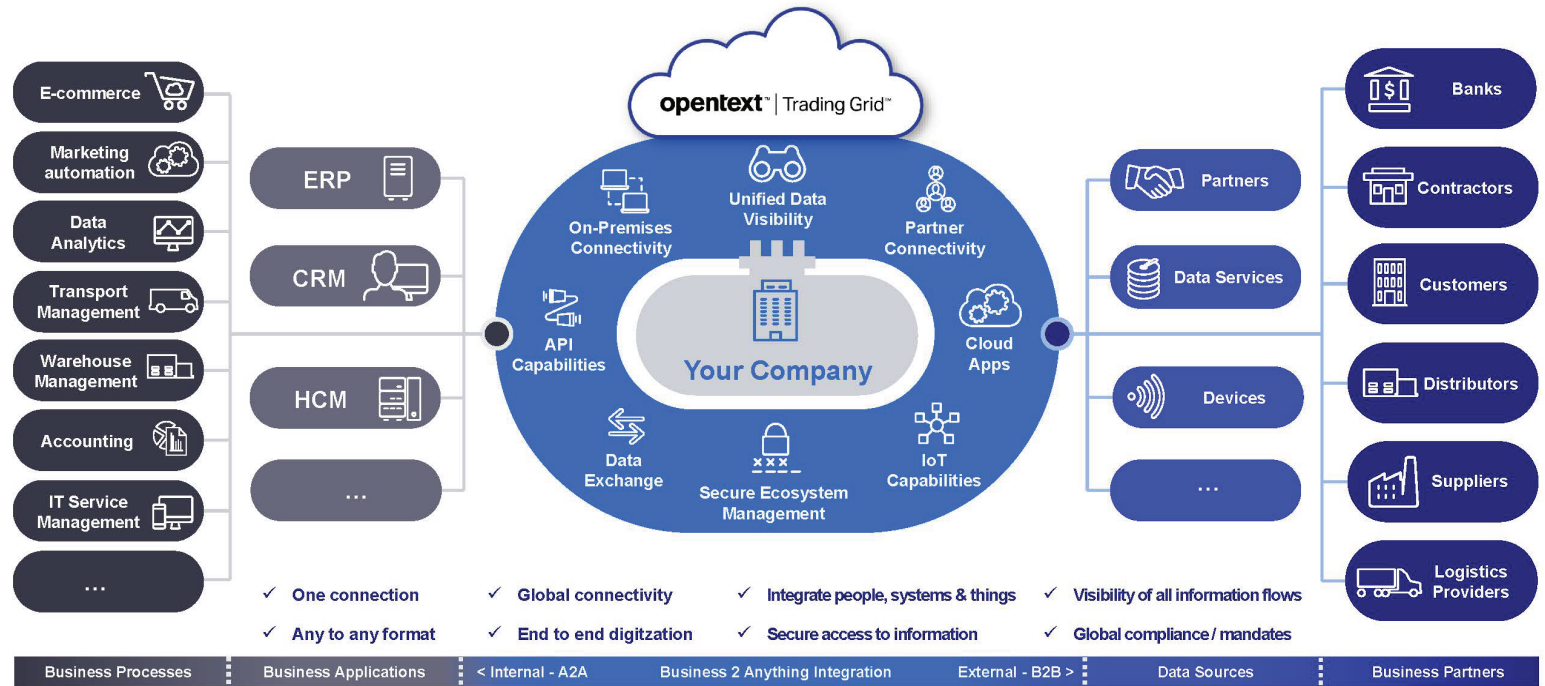

- Leverage economies of scale in infrastructure to lower operational costs
- Leverage availability of in-demand technical skills to optimize human capital costs
- Enable partners with visibility and self-service to lower inquiry and onboarding time

# opentext™ | Trading Grid™

The industry's only unified integration platform connecting 1 million trading partners and processing 26 billion transactions per year.

The platform is a cloud-based environment, providing the flexibility and scalability to connect, optimize, and grow a business.

## OpenText Trading Grid – Connect Once. Reach Anything.

### Single Unified Platform

Support complex integration needs and business demands with a single solution to improve governance and efficiency

### Power of the Network

Leverage pre-built cloud community to extend reach to any partner, any region and accelerate time to value

### Enable the API Economy

Manage growing integration complexity and demands for speed, while embracing old and new forms of integration

### Self-service or full managed services

A tiered approach to business integration, empowering any size company to leverage an enterprise-grade integration platform
