

OpenText Data Protector and CloudAlly

Protect cloud and on-premises workloads from cyberthreats and IT disasters with backup and recovery

Benefits

- **Comprehensive** cyberthreat protection for digital assets
- **Improve** compliance with data protection regulations
- **Back up** and recover cloud SaaS content
- **Protect** heterogenous IT with on-premises backup and recovery

Enterprises of all kinds are trapped between cyberthreats, internal data related threats, IT disasters, and increasing data protection compliance requirements. Many have increasingly heterogenous IT, from cloud solutions to on-premises data, that needs to be protected. Businesses often assume SaaS applications are secure, but the Shared Responsibility Model doesn't prevent data loss.

OpenText™ Data Protector and CloudAlly™ equip organizations to prevent data loss, protect against ransomware, consolidate backups, and achieve regulatory compliance.

OpenText Data Protector helps organizations protect their critical data across physical, virtual, and cloud workload environments via enterprise-grade data backup and recovery. Centralized management of back-up and recovery operations enables IT administrators to efficiently protect and recover their data across a wide range of platforms and applications. Automate back-up and recovery tasks, reduce the risk of data loss, better comply with regulations, and improve IT reliability and efficiency. Fast restoration ensures operations quickly return to normal, minimizing revenue loss and maintaining reputation.

CloudAlly protects data for all your SaaS applications, such as Microsoft 365®, Google® Workspace™, Salesforce®, Box™, and Dropbox™ through a single, easy-to-use interface. Eliminate the risk of data loss and mitigate regulatory and legal risk with the ability to rapidly recover data from any point in time and with any granularity.

“One of the big OpenText Data Protector advantages is the native application integration for all our clients’ database systems, SAP being the key one. We provide online backup capabilities without negatively impacting the source systems, so performance remains at the same level while the backup is performed, a crucial feature for our clients.”

Comprehensive cyberthreat protection for digital assets

Backup and recovery are the last line of defense for cyberattacks. If managed well, they will protect you from external and internal attacks and drive a rapid return to normal IT operations.

OpenText Data Protector and CloudAlly provide a universal back-up solution for all your storage solutions, databases, hypervisors, on-premises hosted SAP®, and cloud hosted SaaS content like Salesforce and Microsoft 365.

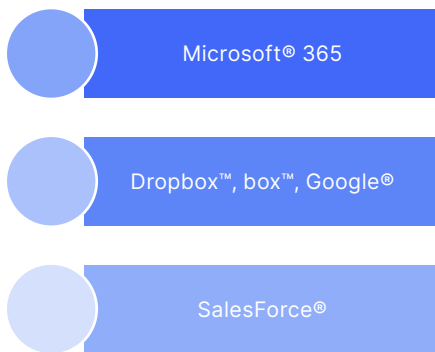

Improve compliance with data protection regulations

Most organizations do business in one or more territories, which either directly or indirectly enforce a reasonable back-up and restore policy. The European Union (EU) and Australia have legislation in place requiring organizations to be well prepared for cyberattacks. Other countries, like the United States and Canada, are suggesting secure behaviors for digital infrastructure.

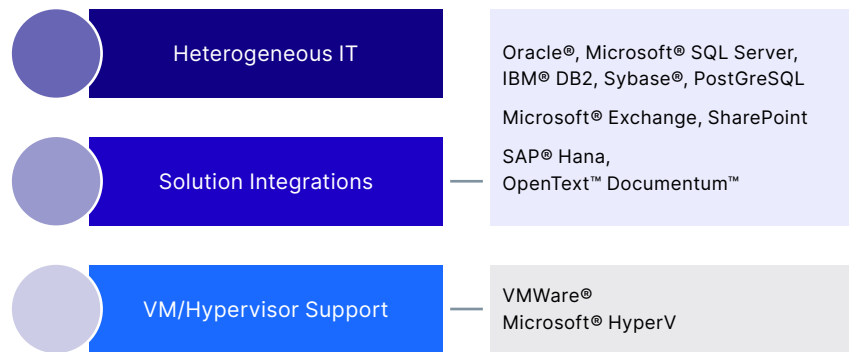

In either case, not following these regulations or suggestions can have severe financial impacts. In Europe and Australia, organizations face high fines when not complying with GDPR and NIS2 regulations. In North America data breach settlements, drastic payments can put organizations out of business.

OpenText Data Protector and CloudAlly make sure cyberthreat-related compliance regulations are met while maintaining proper documentation.

CloudAlly

OpenText Data Protector

Solution	Description
OpenText Data Protector	Prevent data loss, protect against ransomware, consolidate backups, and achieve regulatory compliance whether virtual, physical, or off-cloud.
CloudAlly	Comprehensive backup and recovery of SaaS application data with central management, granular restore, rapid recovery, and flexible retention options.

Back up and recover cloud SaaS content

CloudAlly offers comprehensive backup and recovery of SaaS application data and boasts central management, granular restore, rapid recovery, and flexible retention options. This purpose-built backup solution ensures IT administrators can recover as much or as little SaaS application data as necessary.

On-premises backup and recovery for heterogeneous IT

OpenText Data Protector is an enterprise-class, data-centric backup and disaster recovery solution that addresses the challenges of complexity, scalability, and data security in dynamic and diverse IT environments. Based on a unified, flexible, multi-tier architecture, it enables centralized data protection across physical, virtual, and cloud environments.

Establish a single backup and recovery solution that can back up and restore anything: modern cloud SaaS content, heterogeneous on-premises, and/or data center IT. OpenText Data Protector protects enterprise software solutions, many databases, and all major hypervisors (VMs). Software deduplication and support for appliance-based storage and deduplication are also included. Together with CloudAlly, it provides comprehensive protection from data loss through cyberthreats or other incidents.
